④

↳ Concepts Under Quantitative Aptitude:-

1) Percentages
2) Profit & Loss
3) Simple Interest & Compound Interest
4) Time & Work and Pipes & Cisterns
5) Time, Speed & distance, Trains and Boats & Streams
6) Ratios & Proportions and Averages & Ages
7) Partnership and Allegations & Mixtures
8) Number Systems
9) Mensurations
10) Permutations & Combinations and Probability.
11) Clocks & Calendars.
12) Logarithms and few Pure maths concepts.

↳ Concepts under Reasoning Aptitude:-

1) Coding & Decoding
2) Series & Sequences
3) Directions
4) Blood Relations
5) Puzzle solving & Riddles
6) Seating Arrangements
7) Mirror Images & Water Images
8) Data Interpretation
9) Data Sufficiency
10) Non-Verbal figure Series.

↳ knowing time saving techniques:-

↳ The main important one to crack any Aptitude test is to learn time managing (or) time saving methodologies. i.e., Vedic maths techniques (or) fast calculation techniques.

(i) Finding squares:- [To know resultant digits to 'n' digited square]

(i) first method:- Base method:-

Ex:- 96^2 Base is $\rightarrow 100$

Resultant digits are _ _ _ _

Step1:- Consider the difference b/w base & given Number (96)

$100 - 96 = 4$

Step2:- square of difference is to be occupied by last digits & it is to be placed on given number with sign (-/+ (or) decreased/increased) like $\overset{-4}{96}^2$

_ _ 1 6 and $\overset{-4}{96}^2$

Step3:- What ever difference is there that is to be substracted/added with respect to its sign from the given number and the resultant is to be occupied (or) placed from starting vacant places. If any left out places are there then fill them with 0s.

$(96-4)$

9 2 1 6 $= 96^2$

(ii) Second method:- $(a+b)^2 = a^2 + 2ab + b^2$ method:-

Step1:- 96 is to be considered as a & b which

(6) ↳ $\begin{array}{c|c} a & b \\ 9 & 6 \end{array}$

$a^2 = 81$, $2ab = 2 \times 6 \times 9 = 108$, $b^2 = 6^2 = 36$

Step2:- We have to place the 4 vacant spaces in such a way that no. of digits in 'b' ($b \geq 1$ digit), ($a \geq 1$ digit)

a^2	$2ab$	b^2
81	108	36
+11	+3	
92	111	

↳ 9 2 1 6

'3' is carry forwarded to 108 and added to it & resultant is to be considered

↳ one digit from 111 (units digit) to be placed at 2nd position from right in the resultant.

↳ '11' is carry forwarded to 81 & added, resultant is $81+11 = 92$ and is to be placed in the remaining vacant spaces.

81	108	36
+11	+3	
(92)	(111)	

↳ 9 2 1 6

Note:- 2nd method is easiest method to find squares

(iii) Squares of numbers ends with '5':-

45^2 → let consider $a = 4$ then.

$a5^2$ → Resultant is 4 digited number.

Resultant is $\underline{a(a+1)}\ \underline{5^2} = \underline{4(4+1)}\ \underline{5^2}$

$= 2025$
