1) An employee works for an employer for 7 days. The employee has a gold rod of 7 units. How does the employer pays to the employee. So that the employee gets 1 unit at the end of every day. The employer can make at most 2 cuts on rod?

Ans:- 2 cuts he can make on such a way that

2) 100 people standing on a circle in an order 1 to 100. No.1 has a sword. He kills the next person (i.e., No.2) & gives the sword to the next (i.e., No.3). All people do the same until only 1 survives. Which number survives at the last?

Ans:- In Round 1:- 1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 45, 47, 49, 51, 53, 55, 57, 59, 61, 63, 65, 67, 69, 71, 73, 75, 77, 79, 81, 83, 85, 87, 89, 91, 93, 95, 97, 99.

Round 2:- 1, 5, 9, 13, 17, 21, 25, 29, 33, 37, 41, 45, 49, 53, 57, 61, 65, 69, 73, 77, 81, 85, 89, 93, 97.

Round 3:- 1, 9, 17, 25, 33, 41, 49, 57, 65, 73, 81, 89, 97.

Round 4:- 9, 25, 41, 57, 73, 89

Round 5:- 9, 41, 73

Round 6:- 9, 73

Round 7:- **73**

3) How many max runs a single player can score in one day match (50 overs / 300 balls). No 'no balls', no wides, no overthrows.

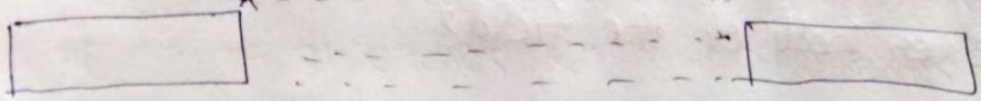

Ans: To play whole match by a single player, every over last ball he should hit & score maximum of 3 runs only. & the remaining 5 balls as 5 sixes till 49th over & in 50th over 6 balls 6 6's he can hit. SO,

49 overs score $(49(5\times6+1\times3))$ + Last over score (6×6)

Total score $= (49\times33+36) = 1617+36 = 1653$.

4) A fly is flying b/w two trains, each travelling towards each other on the same track @ 60 kmph. The fly reaches one engine, reverses itself immediately, and flies back to the other engine, repeating process each time. The fly is flying @ 90 kmph. If the fly flies 180 km. before the trains meet, how far apart were the trains initially?

Ans:-

here fly is travelling with 90 kmph & travelled 180 km totally before trains meet. Means time for the dist b/w trains travelled by fly $= \frac{d}{s} = \frac{180}{90} = 2$ hr's.

Means trains travelled 2 hr's with relative speed (S_1+S_2) before they meet. i.e., dist b/w trains only.

dist b/w trains = time $\times$ (R.S) $= 2\times(60+60) =$ **240 km**
