5) You have 2 buckets of water, inside the 1st bucket the temperature is 25°C, in 2nd. 25°F. You drop a coin into each from the same height & they hit water @ exactly same time. which coin touches the bottom first?

Ans:- If we convert both temperatures into same units.

Degree to fahrenheit formula = $[n°C \times \frac{9}{5}] + 32$

here 'n' is given °C value

$25°C$ into $°F = [25°C \times \frac{9}{5}] + 32 = 77°F$.

According to kinetic energy which is having more temperature, in that speed of object is more.

∴ the coin touches the bottom of bucket in **25°C (77°F)** temperature bucket.

6) In a field, there is a patch of magic grass, which doubles in quantity every day. If on day one it's one patch of grass, on 2nd 2 ... so on. It takes 10 days for the grass to cover the entire field. How long will it take to cover half of the field?

Ans:-

1	2	4	. . . . .	full field.
1st	2nd	3rd.		10th day

on 9th day it is half field grass then only it will become double on next day & on 10th day it will become full of grass on field.

So, answer is on **9th day**.

7) There are 3 boxes in a table. One of the box contains Gold & the other two are empty. A printed message contains in each box. One of the messages is true & other 2 lies.

The first message in box 1 says → "The gold is not here".

2nd box says → "The gold is not here"

3rd box says → "The gold is in the 2nd box".

Which box has the gold?

		1st As	2nd As.	3rd As.
Ans-	Box 1 → The Gold is not here →	T	F	F
	Box 2 → The gold is not here →	F	T	F
	Box 3 → The gold is in 2nd box →	F	F	T

1st Assumption & 2nd Assumption not satisfying but 3rd Assumption satisfying & gives the answer as gold is in [1st box]

8) Use only 0 (zero) 3 times & find the number 6?

Ans:- $(0! + 0! + 0!)! = (1+1+1)! = 3! = 6$

9) If you devide 30 by half & add 10, what do you get?

Ans:- $\frac{30}{1/2} + 10 = 60 + 10 = 70$

10) Three friends devide some bullets equally. After all of them shot 4 bullets the total remaining becomes the bullets each had after division. Then original bullets?

Ans:- Lets assume original bullets as 'x'

Deviding to each equally gives $\frac{x}{3}$.
