Scheduling algo :-

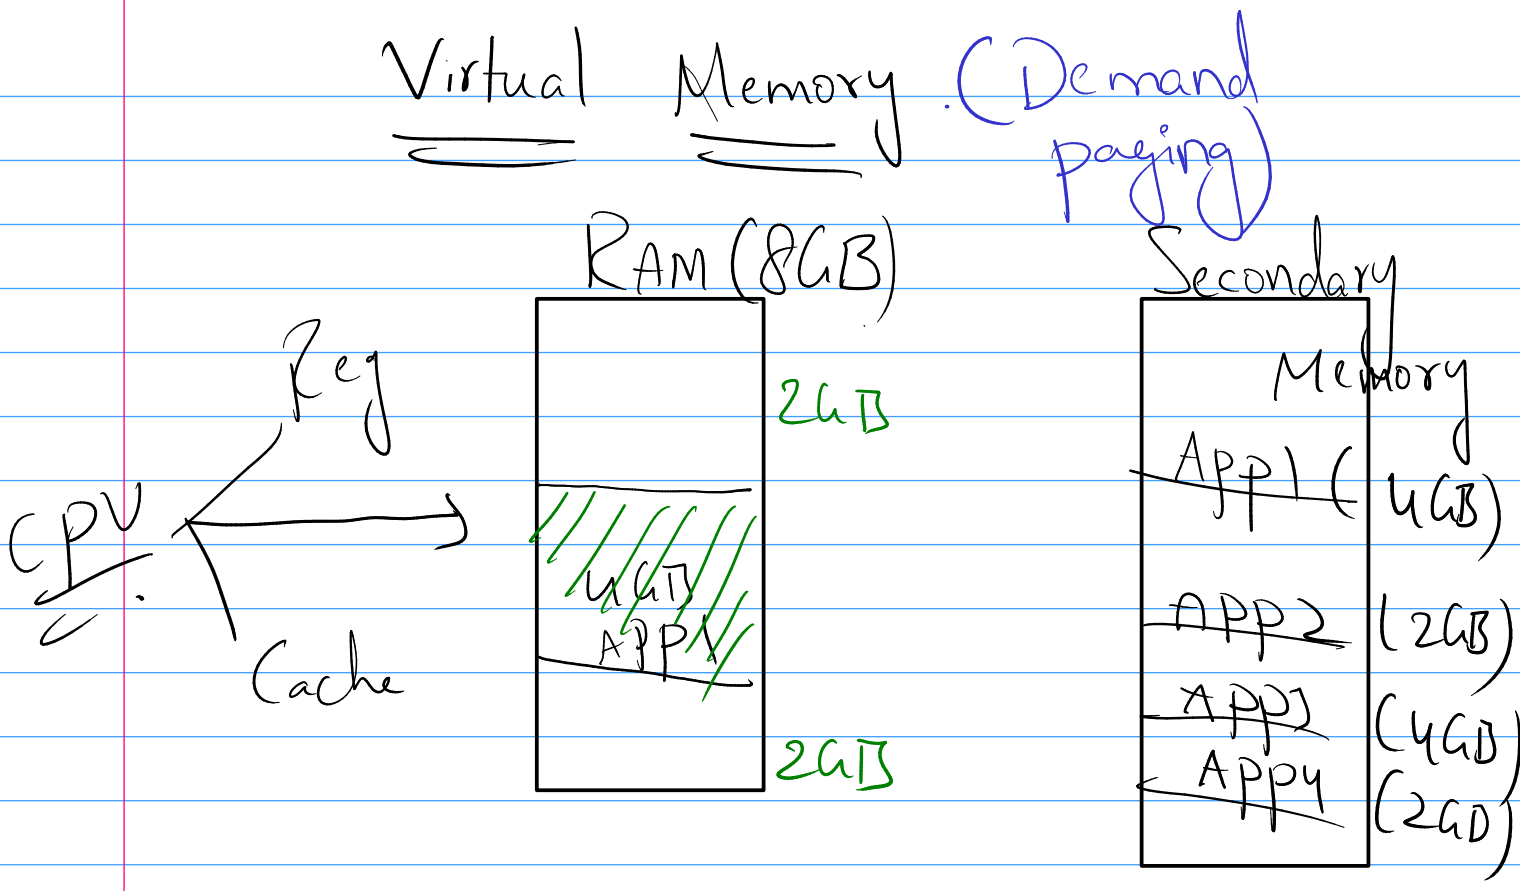

priority band → RR → R.T

fairness

turnaround

nice

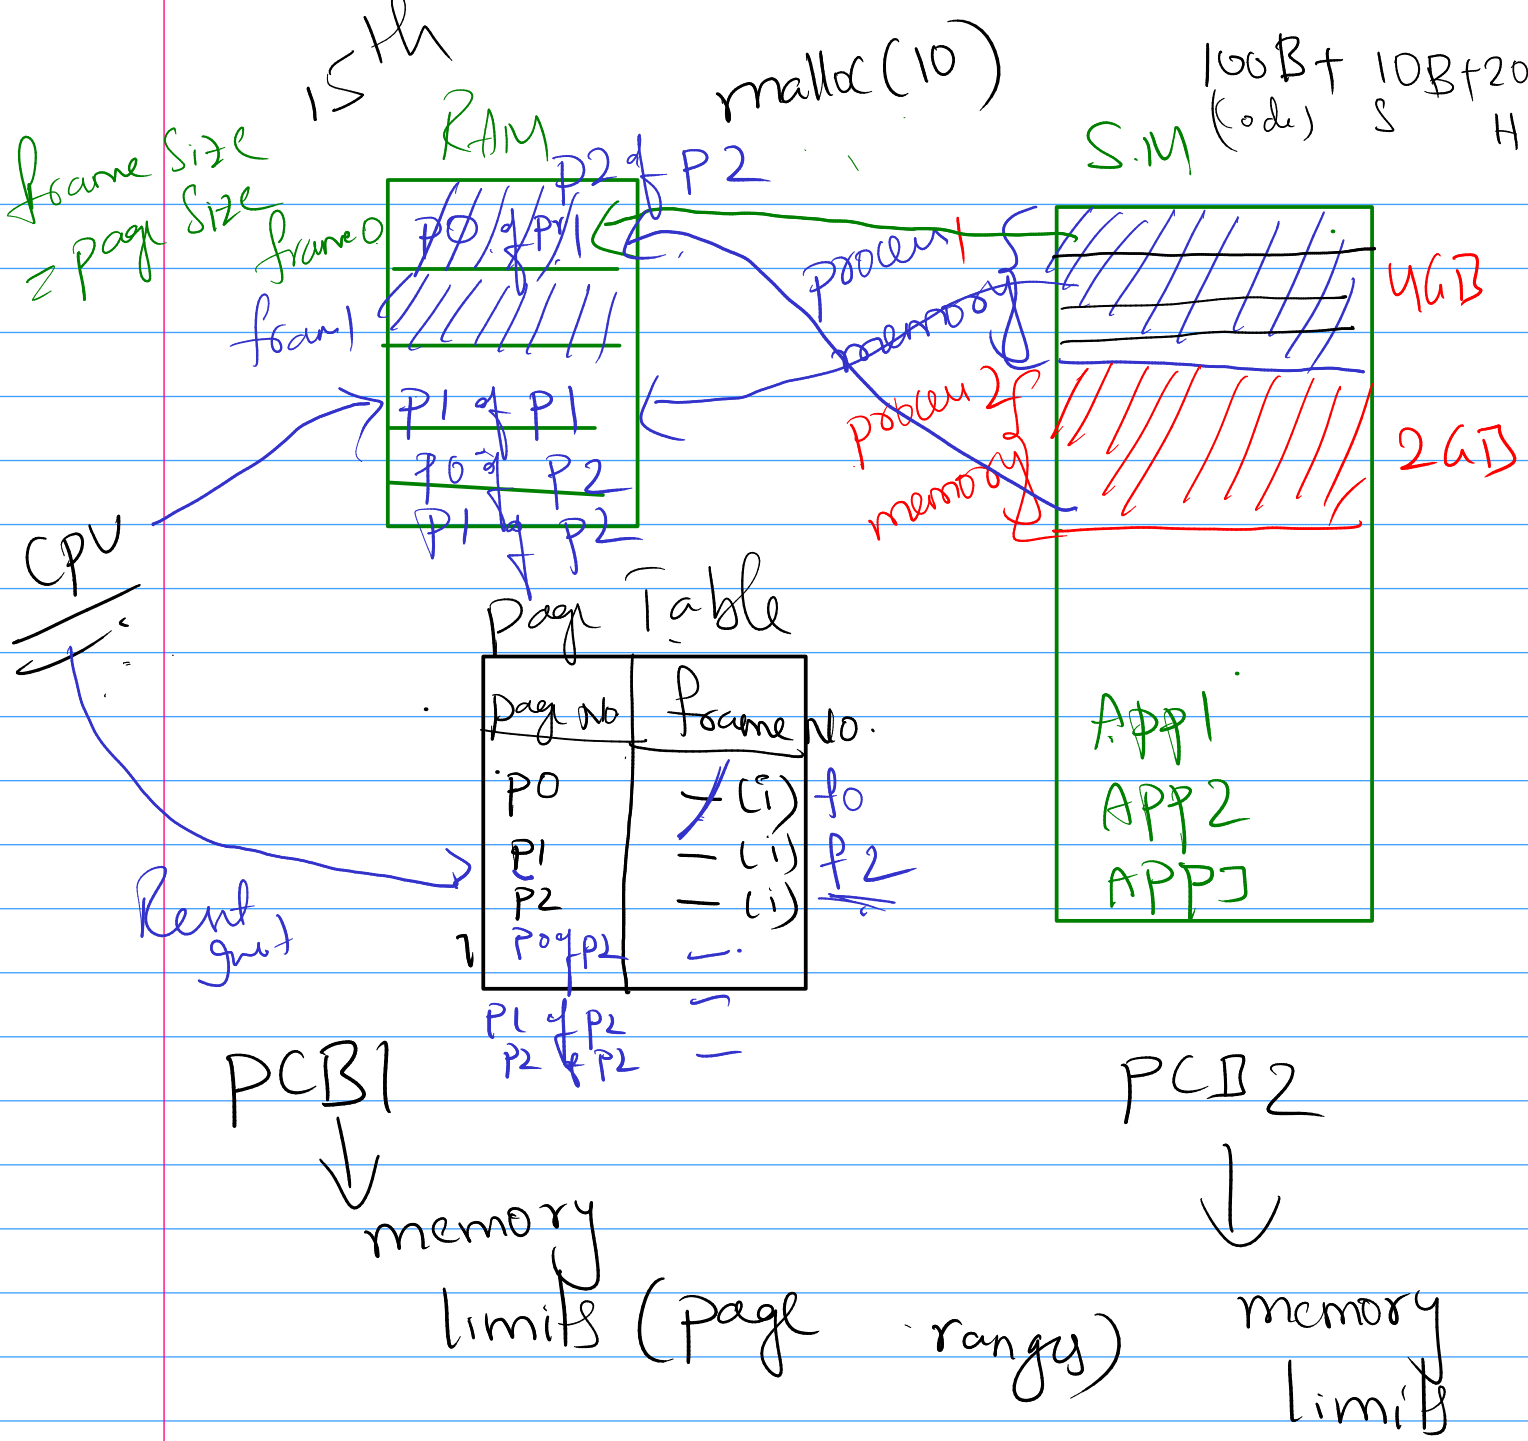

Virtual Memory (Demand paging)

Virtual Memory :-

It is a illusion of extending RAM.

→ RAM Size more → Speed high
↳ chances of occuring page faults is less.

page fault :-

If Requested page is missing in the RAM then page fault occurs.

↓

TRAP Signal

↓ high priority

O.S (MMU)

Swap out (page out)

:- when RW page is getting replaced with a new page then older one should swapped out from RAM

Swap In :-

- when a page is demanded by the CPU and not there in RAM then page fault occurs then page will be Swapped in to the RAM.
