priority inversion :-

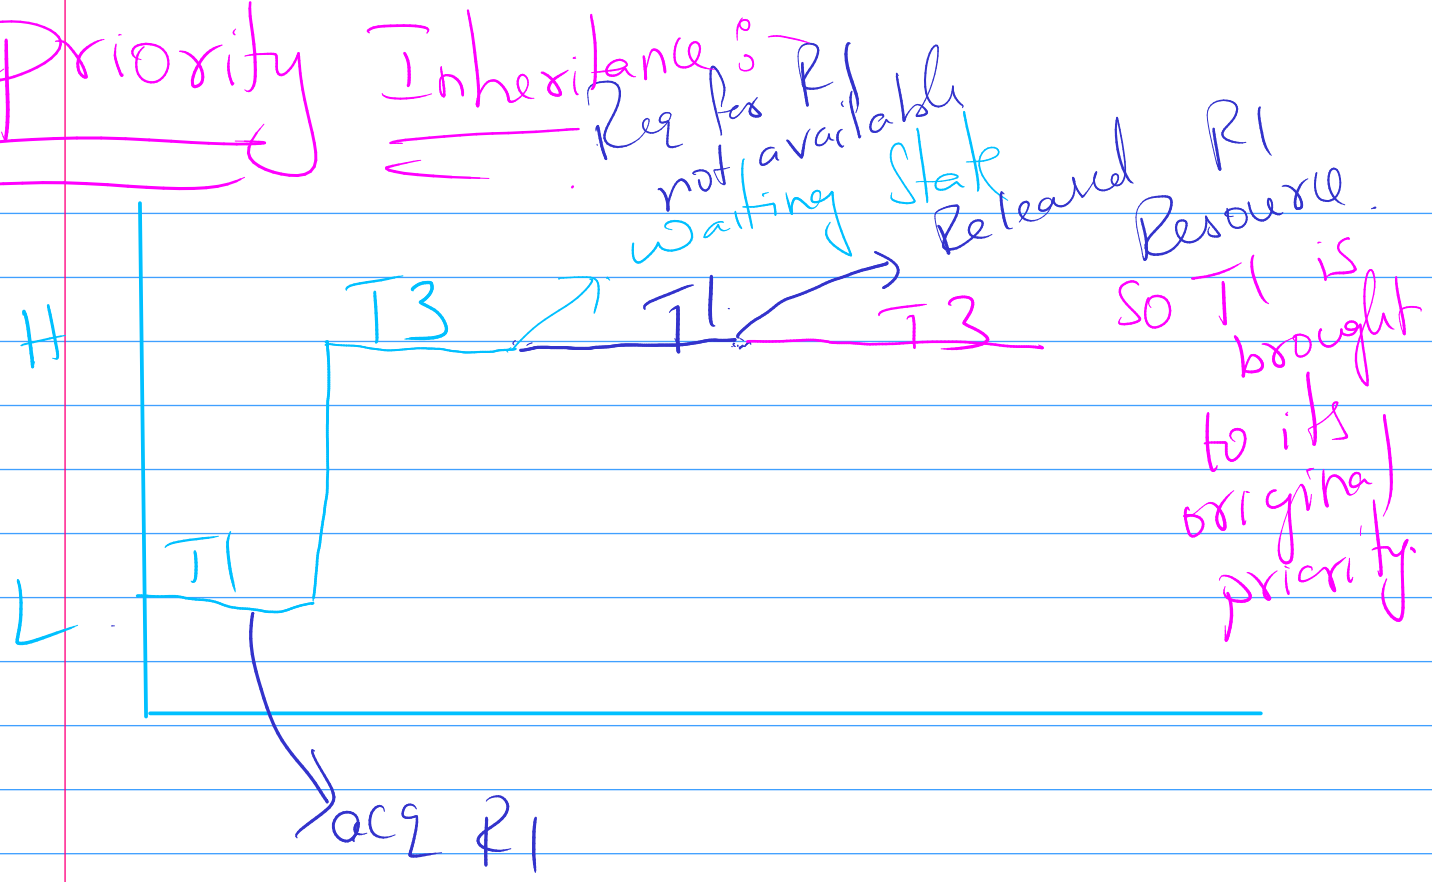

T1 T2 T3

L M H

Solutions for priority inversion problems :-

1- Priority Inheritance :-

2 Ceiling priority protocol :-

Highest is the numby highest is priority

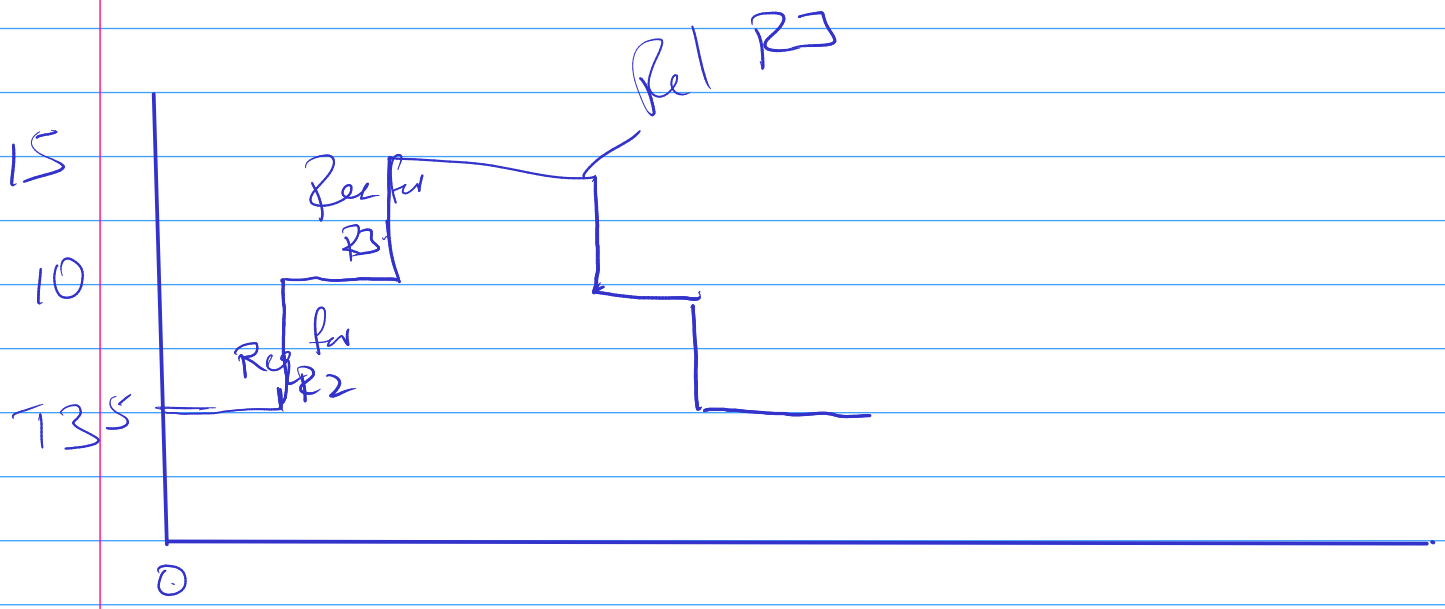

T_name	T1	T2	T3	T4
T_priority	10	15	5	3
T_resource	R1, R2	R3	R2, R3	R4

priority Ceiling of R1 = priority of T1
= 10

priority ceiling of R2 = Max. priority (T1, T3)
= 10

" " " R3 = 15

" " " R4 = 3

RTOS

— features

Appl^n areas

List of Some RTOS names.

why RTOS ? (multi tasking)

RTOS characteristics

Critical section

Task / Thread, Task states

TCB

Synchronization objects
(spinlock, mutex, Semaphore
mailbox (msg queue))

Reentrant function

Interrupt Handling

priority inversion, Priority inheriting
Ceiling priority protocol.

→ which RTOS you have worked with?
(RL-RTX)

→ How RL-RTX is better over other RTOS?
