WORKSHOP : FILE MANAGEMENT

Objective :

To understand file management, mainly to open a directory, reading file status, getting inode number for a file , getting time of the file when lastly opened comparing two files.

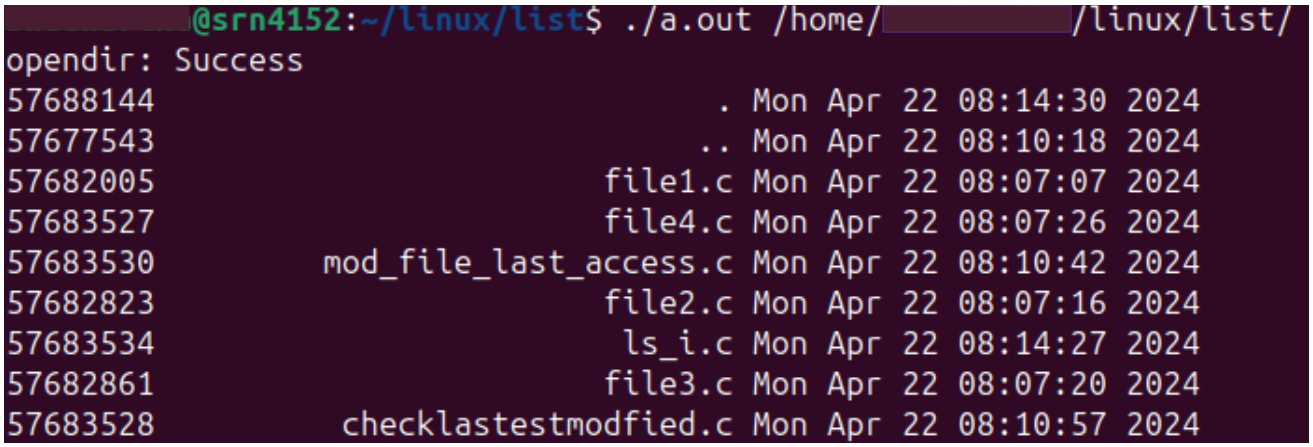

Task 1 :

Implement ls -i command with time.

Requirements :

1. Open the directory by using opendir() system call.
2. Read the directory by using readdir() system call.
3. Get the file status by using stat() system call.
4.convert epoch time into time(Ascii) by using ctime() function.

Ex:

Task 2 :

Modify the file access time to 1 month before.

Requirements :

1. Get the file status by using stat() system call.
2. By using utimbuf structure can change the actime(actual time) and modtime(modified time).
3. After changing the time update to the file by using utime.

Before modification:

After modification

Task 3 :

Compare two file which oldest file and newest file.

After comparing two files
