WROKSHOP : PROCESS MANAGEMENT

Objective:

To understand process mangement, mainly to create child proceses and how they are executing , exit status , collecting exit status by parent.

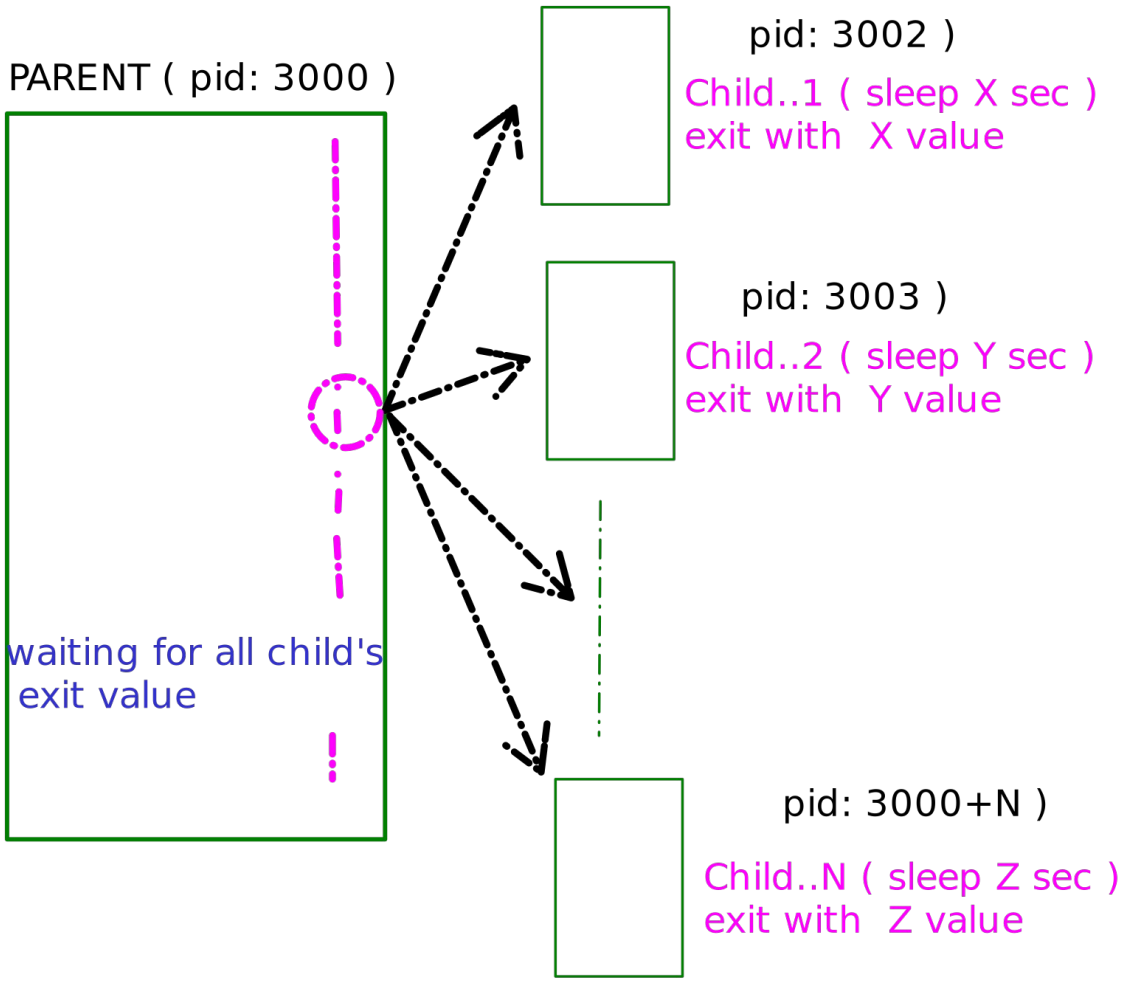

TASK:

The application when executed , parent will create **N** child process which is supplied in commandline.

Make wait each child for **S** sec which is generated randonly and then , parent must wait untill **N** child terminate.

Collect exit status of that specific child and print exit value in parent.

Version1: **Make parent wait untill terminate all child processes. and must collect exit status of evry child and print on screen**

Version2: **Make parent wait untill particular child process terminate and must collect exit status of that child and print on screen**

Note: Specific child also need to choose randomly.
